VI.	TEP Climate Change Statements	8
VII.	Recommendations	10

Attachment A - Curriculum Vitae

1 **I. INTRODUCTION**

2 **Q: WHAT IS YOUR NAME AND BUSINESS ADDRESS?**

3 A: My name is Autumn Johnson. My business address is P.O. Box 30497, Phoenix, Arizona
4 85046.

5 **Q: WITH WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

6 A: I am an Energy Policy Analyst for Western Resource Advocates (WRA) in the Clean
7 Energy Program. In that role, I advise on policy and other matters related to electric
8 utilities and their resource development and operation, decarbonization of the electric
9 grid, and electrification of transportation, primarily within Arizona.

10 **Q: DESCRIBE YOUR EDUCATION AND PROFESSIONAL EXPERIENCE.**

11 A: I hold a bachelor's degree (BA) from the University of Arizona. I also hold a law degree
12 (JD) from the University of Oregon, where I focused on environmental law. I hold a
13 Master of Business Administration (MBA) from Seattle University. Lastly, I am
14 currently pursuing a Doctor of Philosophy (PhD) at Boise State University in Public
15 Policy and Administration.

16 In addition to being an Energy Policy Analyst for WRA, I teach environmental law and
17 policy at Concordia University School of Law. Before working for WRA, I was the
18 Assistant Director of the Energy Policy Institute (EPI) at Boise State University, which is
19 a think tank focused on clean energy research. Past EPI research includes work on utility
20 scale solar siting, the economics of small modular reactors (SMRs), Regional
21 Transmission Organization (RTO) expansion in the west, and nuclear waste storage,
22 among other work. Within this role, I also participated on the Idaho Power Integrated
23 Resource Plan (IRP) Advisory Council, attended Idaho Public Utility Commission (PUC)
24 technical hearings, and attended conferences. Attachment A to this testimony is a copy
25 of my resume, which more completely describes my background and education.
26

1 Q: IS THIS YOUR FIRST TESTIMONY BEFORE THE ARIZONA CORPORATION
2 COMMISSION?

3 A: Yes.

4 II. PURPOSE OF TESTIMONY

5 Q: WHAT IS THE PURPOSE OF YOUR TESTIMONY?

6 A: I am supporting WRA's recommended planned retirement dates for certain Tucson
7 Electric Power (TEP) fossil fueled power plants. I am also introducing the other
8 witnesses WRA is sponsoring in this rate case: Mr. Michael Majoros, Mr. James Gareen,
9 and Mr. Brendon Baatz, who is co-sponsored with the Southwest Energy Efficiency
10 Project (SWEEP). Mr. Majoros is President and CEO of SKM & Associates, a
11 consulting firm specializing in depreciation, accounting, financial, and management
12 issues. James Gareen is the Vice President of SKM & Associates. They are providing
13 testimony to recommend particular depreciation schedules for TEP assets that would
14 allow the company to incorporate WRA's recommendations for fossil fuel generation
15 retirements without impacting customer rates. Mr. Baatz is Vice President of Gabel
16 Associates, a consultancy focusing on energy, environmental, and public utility matters.
17 He is providing testimony on cost recovery of energy efficiency investments and
18 electrification of the transportation sector, among other topics.

19 My testimony is intended to highlight the policy implications of continued fossil fuel use
20 by TEP and to recommend that TEP's retirement of its fossil fueled generation fleet be
21 aligned with the scientific and policy goals and requirements, which TEP has
22 acknowledged and will likely be subject to in the future. The Arizona Corporation
23 Commission is currently considering modification of its Renewable Energy Standard and
24 Tariff (REST) rules, neighboring states have announced increased renewable and clean
25 energy standards, utilities all over the country have committed to decarbonization goals,
26 and the three largest utilities in Arizona have publicly or privately committed to

1 announcing their own decarbonization goals by April 2020, if they have not done so
2 already. TEP is working with the University of Arizona to establish its own
3 decarbonization goals.

4 **III. SUMMARY OF RECOMMENDATIONS**

5 **Q: PLEASE SUMMARIZE YOUR CONCLUSIONS AND RECOMMENDATIONS.**

6 A: TEP's proposed advancement of planned retirement dates of some of its thermal
7 resources should be approved. Further, the Commission should reject TEP's proposal to
8 extend the lives of its gas fired thermal resources beyond 2050. TEP's planned
9 retirements for its natural gas plants should align with TEP's stated view of the future of
10 fossil fueled generation.

11 Recent research suggests that the natural gas market is headed in a similar direction to
12 coal and new or continued investment in natural gas plants introduces regulatory and
13 economic risks that will likely be borne by customers.¹ Renewable energy and storage
14 are now cost competitive with natural gas.² Shortening the expected service lives of
15 TEP's thermal resources will help to ensure that these plants do not become stranded
16 assets.

17 **IV. TEP THERMAL UNITS' SERVICE LIVES**

18 **Q: HOW DOES TEP PROPOSE TO SHORTEN THE SERVICE LIVES OF ITS**
19 **THERMAL PLANTS?**

20 A: Mr. Sheehan proposes shortening the expected service lives for all units at Navajo
21 Generating Station (NGS) and Springerville Generating Station (SGS), as well as three
22 units at Sundt Generating Station (Sundt). TEP proposes shortening the depreciation life
23 of NGS by 11 years from 2030 to 2019 and shortening the depreciation life of SGS by
24 five years from 2045 to 2040 for Unit 1 and from 2050 to 2045 for Unit 2. TEP proposes

25 ¹ See Rocky Mountain Institute's report, *The Growing Market for Clean Energy Portfolios and Prospects for Gas*
26 *Pipelines in the Era of Clean Energy*, Sept. 9, 2019. <https://rmi.org/a-bridge-backward-the-risky-economics-of-new-natural-gas-infrastructure-in-the-united-states/>.

² WRA Comments filed on July 12, 2019, RU-00000A-18-0284. <https://docket.images.azcc.gov/E000001787.pdf>.

shortening the depreciation life of Sundt (Units 1, 2, and 4) by 8 to 11 years, depending on the unit, with the last to close in 2037 instead of 2048. To accomplish these shorter depreciable lives without an adverse rate impact, TEP proposes to extend the service life of its gas fired generation.

Q. HOW DOES TEP PROPOSE TO EXTEND THE EXPECTED SERVICE LIVES OF ITS GAS PLANTS?

A: TEP proposes to extend the life of the Gila River Power Station (Gila River) by 15 years, thereby moving its retirement date from 2048 to 2063. TEP also proposes to extend the life of the Luna Energy Facility by 15 years, thereby moving its retirement date from 2051 to 2066. TEP also proposes extending the life of Sundt's CTs (Units 1 and 2) by five years, thereby moving their retirement date from 2027 to 2032.

TEP also intends to purchase Gila River Unit 2 in 2019, with the same life span as the other Gila River Unit mentioned above. This would indicate TEP's intention to run Gila River Unit 2 until 2063. TEP is proposing a 45-year life cycle for its new RICE units.

Q. DO YOU SUPPORT TEP'S PROPOSAL TO EXTEND THE SERVICE LIVES OF ITS GAS PLANTS?

A: No. Using fossil fuel units so far into the future does not align with TEP's recent public statements, electric industry trends, or science-based climate goals. TEP has articulated a goal to decarbonize its system in compliance with the best available science in both their Preliminary Integrated Resource Plan (PIRP) and in public presentations at the Commission. TEP announced to the Commission at the September 19, 2019 IRP Workshop that it is working with the University of Arizona to establish its own, science-based decarbonization goals. This is in line with dozens of other utilities that have already announced decarbonization goals,³ including Dominion, Entergy, NextEra, Xcel, Idaho Power, Avista, PNM, NV Energy, SRP, Southern Co., and Duke, among others.

³ Ceres, *Climate Strategy Assessments for the US Electric Power Industry: 2019 Update*, Table 2, August 2019. https://www.ceres.org/sites/default/files/reports/2019-08/Ceres_ElecSectorClimateStratAssess_Update_081319.pdf.

1 These utility announcements are in addition to several states and over 100 cities.⁴ These
2 goals reflect an intention to stop using fossil fuels by mid-century.

3 While natural gas plants typically emit less greenhouse gases than coal plants, they are
4 still carbon emitting resources. Depreciating and, potentially, running gas plants until the
5 2060s is inadvisable for rate payers and the environment. Recent research indicates that
6 natural gas is going the way of coal. Due to falling prices for renewables and
7 technological innovation in storage technology, gas may be uneconomical in the near
8 future.⁵ Therefore, extending the lives of these plants runs the risk of creating stranded
9 assets.

10 Mr. Sheehan states that TEP needs to extend the lives of these plants because “there will
11 be a need to maintain an adequate supply of backup thermal generation to support real-
12 time grid operations,” and that TEP “need[s] to maintain existing natural gas capacity as
13 the Company reduces and eventually eliminates its reliance on coal-fired generation.”⁶
14 Given existing renewable and storage technology, as well as continued technological
15 innovation, TEP should plan to also eliminate its reliance on natural gas by mid-century,
16 and certainly sooner than 2066.

17 **V. RISKS TO CUSTOMERS**

18 **Q: IS THERE A RISK TO CUSTOMERS OF DEPRECIATING THESE PLANTS AS**
19 **RECOMMENDED?**

20 **A:** No. The depreciation schedules we support strive to be rate neutral but will prepare TEP
21 and its customers for a decarbonized future while mitigating the financial risk of stranded
22 assets. Testimony from WRA’s witnesses, Mr. Majoros and Mr. Garren, present one
23

24 ⁴ Sierra Club, *100% Commitments in Cities, Counties, and States*, [https://www.sierraclub.org/ready-for-](https://www.sierraclub.org/ready-for-100/commitments)
25 [100/commitments](https://www.sierraclub.org/ready-for-100/commitments).

26 ⁵ Rocky Mountain Institute’s report, *The Growing Market for Clean Energy Portfolios and Prospects for Gas Pipelines in the Era of Clean Energy*, Sept. 9, 2019. <https://rmi.org/a-bridge-backward-the-risky-economics-of-new-natural-gas-infrastructure-in-the-united-states/>.

⁶ Direct Testimony of Michael Sheehan, page 10, lines 9-12.

option for how TEP can depreciate its fossil fuel plants with no or minimal costs to customers and without extending the depreciable lives of its gas plants.

Q: DOES CLIMATE CHANGE POSE A RISK TO CUSTOMERS?

A: Yes. Climate change poses risks of increased temperatures, drought, and wildfires in Arizona.⁷ Additionally, carbon emissions coincide with water and air quality problems.⁸ Further, investments in fossil fuel plants that will not be paid off until 2066 create economic risks that may be passed on to customers as stranded assets. It is prudent for utilities, like TEP, to take note of changes within the industry. When other states, hundreds of cities, and dozens of utilities all over the country are announcing plans to decarbonize, that indicates a directional shift in energy sector practices and public policy, which affects customers.

VI. TEP CLIMATE CHANGE STATEMENTS

Q: HAS TEP RECOGNIZED THE TRENDS YOU IDENTIFY ABOVE AND MADE STATEMENTS RELATED TO CLIMATE CHANGE?

A: Yes. To its credit, TEP recognizes the need to transform its generation fleet to accommodate these trends and concerns. In TEP's PIRP, it states:

Our commitment to serve the best interests of our current and future customers and stakeholders compels us to develop a revised goal focused on reducing carbon dioxide emissions. This new, more comprehensive goal, will be based on greenhouse gas reductions that reflect our proportional contribution toward limiting global temperatures to levels outlined in the 2015 Paris Agreement on climate change. To that end, we have enlisted the University of Arizona's Institute for the Environment to help us develop science-based targets that allow us to measure our steps toward a global solution.⁹

⁷ Environmental Protection Agency, *What Climate Change Means for Arizona*, 2016, <https://19january2017snapshot.epa.gov/sites/production/files/2016-09/documents/climate-change-az.pdf>; Arizona Republic, *Study: Climate change could transform Arizona's forests, deserts, worsening drought and fire*, Sept. 1, 2018, <https://www.azcentral.com/story/news/local/arizona-environment/2018/09/01/climate-change-could-transform-arizona-forests-deserts-environment-study/1148294002/>.

⁸ WRA Comments filed on July 12, 2019, RU-00000A-18-0284, <https://docket.images.azcc.gov/E000001787.pdf>.

⁹ TEP PIRP, page 3, <https://www.tep.com/wp-content/uploads/2019/07/TEP-Preliminary-Integrated-Resource-Plan-070119-FINAL-Version-2.pdf>.

Further, in TEP's Form 10-K, filed on February 15, 2019 with the Securities and Exchange Commission (SEC), the Company states, "[t]he effects of climate change may create operational and financial risks for TEP that, if realized, could negatively affect TEP's results of operations, net income, and cash flows." The 10-K goes on to state:

Climate change may impact regional and global weather conditions and result in extreme weather events, including high temperatures, severe thunderstorms, drought, and wildfires. Changes in weather conditions or extreme weather events in TEP's service territory or affecting TEP's remote generation facilities or transmission system may lead to service outages and business interruptions, which could result in an increase in capital expenditures and operating expenses. Any increases in severity and frequency of weather-related system outages could affect TEP's operations and system reliability. Although physical utility assets have been constructed and are operated and maintained to withstand severe weather, there can be no assurance that they will successfully do so in all circumstances. In addition, changes in weather conditions or extreme weather events outside of TEP's service territory could result in higher wholesale energy prices, insurance premiums, and other costs, which could negatively impact TEP's business and operations. Any of these situations could have a negative impact on TEP's results of operations, net income, and cash flows.¹⁰

Q: DO YOU HAVE ANYTHING ELSE YOU WOULD LIKE TO ADD TO YOUR TESTIMONY?

A: Yes. While TEP's efforts to comply with the Paris Agreement are commendable, there is more work to be done. TEP has committed to comply with the Paris Agreement, which strives to keep global temperature rise to 1.5°C.¹¹ The Intergovernmental Panel on Climate Change states that to keep to a 1.5°C increase in global temperature, economy wide carbon emissions must be net zero by 2050, but earlier reductions are also needed, including a 45% carbon reduction by 2030.¹² TEP should continue its efforts to reduce its carbon. The Commission should require TEP to revisit fossil fuel retirement dates in

¹⁰ TEP 2018 10-K, filed with the SEC Feb. 15, 2019, p. 13,

<https://www.sec.gov/Archives/edgar/data/100122/000010012219000004/tep10k12312018.htm>.

¹¹ The Paris Agreement, United Nations, 2015. <https://unfccc.int/process-and-meetings/the-paris-agreement/the-paris-agreement>

¹² Intergovernmental Panel on Climate Change's Special Report, *Global Warming of 1.5° C*, 2018, p.12. <https://www.ipcc.ch/sr15/>

1 future proceedings, including TEP's IRP proceedings. It may be prudent for TEP to
2 retire SGS sooner than proposed in this rate case. In TEP IRP proceedings, 2030 or 2035
3 retirements should be examined.

4 **VII. RECOMMENDATIONS**

5 **Q: WHAT ARE YOUR RECOMMENDATIONS TO THE COMMISSION?**

6 A: The Commission is currently considering increasing the renewable energy requirements
7 under its REST rules. Consistent with that work, TEP should be planning for a low
8 carbon future now. A one for one replacement of coal with natural gas is an insufficient
9 plan. Paying off fossil fuel units sooner, rather than later, mitigates the risk of creating
10 stranded assets and prepares TEP for the likelihood that its proposed exit from fossil
11 fueled generation is not ambitious enough. While TEP's advanced planned retirement
12 dates on some of its fossil fuel units should be approved, TEP should be planning to retire
13 all fossil fuel units by 2050, because the best available science reflects the need to
14 decarbonize by mid-century.¹³ Commitments from many of TEP's peers reflect the
15 industry consensus that this is achievable. For these reasons, WRA makes the following
16 recommendations:

17 First, the Commission should approve TEP's proposal to shorten the service lives of its
18 thermal resources.

19 Second, the Commission should disapprove TEP's proposal to extend the service lives of
20 its gas plants and, if the Commission approves TEP's plan to purchase Gila River Unit 2,
21 it should approve a depreciation life for that unit of no later than 2048.

22 Third, the Commission should approve the depreciation rate adjustments to TEP assets
23 recommended by Mr. Majoros and Mr. Garren, as a means of accepting the first two
24 recommendations without causing an increase in customer rates.

25
26

¹³ *Id.*

1 Fourth, the Commission should require TEP to evaluate the impact of closing SGS sooner
2 in other proceedings, including within the IRPs.

3 **Q: DOES THIS CONCLUDE YOUR TESTIMONY?**

4 **A:** Yes.

AUTUMN T. JOHNSON

PO Box 30497, Phoenix, AZ 85046 • autumn.johnson@westernresources.org • (623) 439-2781 • linkedin.com/in/autumntjohnson

EDUCATION

DOCTOR OF PHILOSOPHY (PhD) • Public Policy and Administration

Boise State University • Boise, ID • 2016-Present • All but Dissertation (ABD)

MASTER OF BUSINESS ADMINISTRATION (MBA)

Seattle University • Seattle, WA • 2015 • Dean's List • Beta Gamma Sigma

DOCTOR OF JURISPRUDENCE (JD)

University of Oregon School of Law • Eugene, OR • 2010 • Law Review • Certificate: Environmental Law

BACHELOR OF ARTS (BA) • Women's Studies and History

University of Arizona • Tucson, AZ • 2006 • Magna cum Laude

PROFESSIONAL EXPERIENCE

ENERGY POLICY ANALYST

Western Resource Advocates • Phoenix, AZ • 2019-Present

- Develop and advocate for policies and mechanisms that reduce the environmental impact of electricity production in the west
- Represent WRA in regulatory, legislative, and other policy forums, including through written and oral testimony
- Provide counsel and strategic advice regarding state and federal energy regulation and administrative law
- Prepare pleadings and testimony for adversarial proceedings
- Negotiate and draft complex settlement agreements
- Assist with guidance of outside experts and legal consultants
- Liaise with electric utilities, the business community, consumer advocates, the environmental community, and other stakeholders to advance clean energy
- Monitor and track relevant state and federal policy developments

ADJUNCT PROFESSOR

Concordia University School of Law • Boise, ID • 2019-Present

- Teach within the Environmental and Natural Resources curriculum
- Develop new courses on agriculture law and energy law

ADJUNCT PROFESSOR

Boise State University, College of Business and Economics • Boise, ID • 2017

- Taught business and commercial law for undergraduate students

ASSISTANT DIRECTOR

Boise State University, Energy Policy Institute • Boise, ID • 2016-2019

- Conducted interdisciplinary research, often related to clean, zero-emission energy
- Published articles and book chapters related to environmental law and policy
- Facilitated business development through grants, contracts, and outreach to collaborators
- Advised on the strategic vision of EPI
- Built and maintained collaborative relationships with internal and external partners
- Managed operations, including reporting to the University and the Center for Advanced Energy Studies (CAES)
- Supervised graduate student workers and undergraduate interns
- Participated on Idaho Power's Integrated Resource Planning Advisory Council (IRPAC)

ADJUNCT PROFESSOR

Seattle University, Albers School of Business and Economics • Seattle, WA • 2016

- Taught business and international law for undergraduate students

PRINCIPAL & MANAGING ATTORNEY

Law Office of Puget Sound • Seattle, WA • 2012-2016

- Managed a law firm that practiced business and intellectual property law for small businesses and nonprofits

- Counseled entrepreneurs, small businesses, and startups in establishing, growing, or closing an entity; writing or negotiating contracts and governance documents; buying and selling businesses; litigation; and registering intellectual property
- Litigated issues ranging from medical malpractice or construction defects to bankruptcy
- Supervised all business operations including budgeting, website development, marketing, contract negotiations, and office administration

JUDICIAL LAW CLERK

Jerome County District Court • Jerome, ID • 2010-2012

- Researched and wrote judicial opinions, judgments, orders, and jury instructions; participated in a dozen court and jury trials
- Counseled the District Judge in all civil cases with damages over \$10,000; all felony criminal cases; appeals from the Magistrate Court; and judicial review of agency actions
- Managed all recruitment and hiring of my replacement at the end of my clerkship term

VOLUNTEER EXPERIENCE

Fresh State Women's Foundation

Phoenix, AZ • 2019-Present

- Provide mentoring and career coaching
- Teach workshops on assertive communication and networking

Idaho Women Lawyers

Boise, ID • 2017-2019

- Member of the Board of Directors & board liaison to the Judicial Recruitment Committee
- Chaired the community service committee

Animal Legal Defense Fund

Cotati, CA • 2019-Present

- Volunteer attorney providing research support on a new legal textbook on industrial animal agriculture

Legal Voice

Seattle, WA • 2012-2015

- Participated in the Self-Help Committee by making legal information readable and accessible to pro se litigants

Idaho State Bar, Animal Law Section

Boise, ID • 2019-Present

- Current member of the Board of Directors

Washington Women's Business Center • SCORE • Fledge, LLC • Rainier Valley Community Development Fund

Seattle, WA • 2013-2014

- Taught seminars and workshops on legal issues affecting small businesses, including intellectual property, contracts, and entity structure
- Counseled small businesses, nonprofits, and startups on potential legal issues and recommended solution

Court Appointed Special Advocate (CASA)

Boise, ID • 2018-2019

- Guardian ad Litem for the Idaho 4th Judicial District
- Advocate on behalf of children in the foster care system

PROFESSIONAL LICENSES & MEMBERSHIPS

- Academy of Food Law & Policy
- American Bar Association and Practice Section: Environment, Energy & Resources
- Arizona Women Lawyers Association
- Association of Women in Energy
- Energy Bar Association
- Oregon State Bar and Practice Sections: Agricultural Law; Animal Law; Energy, Telecom & Utility Law; and Environmental & Natural Resources

Accounts

Exhibit JSG-2: Life Analysis for Adjusted Distribution Accounts.

DIRECT TESTIMONY AND EXHIBITS

OF JAMES S. GARREN

INTRODUCTION

Q. PLEASE STATE YOUR NAME, POSITION AND BUSINESS ADDRESS.

A. My name is James S. Garren. I am an analyst with the economic consulting firm of Snavelly King Majoros & Associates, Inc. ("Snavelly King").

Q. HAVE YOU PREPARED A SUMMARY OF YOUR QUALIFICATIONS AND EXPERIENCE?

A. Yes. Attachment A is a summary of my qualifications and experience.

Q. PLEASE DESCRIBE YOUR BACKGROUND IN UTILITY DEPRECIATION.

A. Since my employment at Snavelly King in 2010, I have participated as an analyst in approximately 30 separate depreciation studies of electric, gas and water utilities on behalf of the firm's clients, most of which are state commissions or state-funded consumer advocate agencies. In that role, I have worked closely with the firm's principals in performing life and net salvage analyses, calculation of depreciation rates, and preparation of testimony. Additionally, I am familiar with the firm's proprietary depreciation software, the Snavelly Comprehensive Investment Analysis System ("SCIAS"). I am also recognized as a Certified Depreciation Professional by the Society of Depreciation Professionals.¹

¹ "The Society of Depreciation Professionals was organized in 1987 to recognize the professional field of depreciation analysis and individuals contributing to this field; to promote the professional

1 **Q. FOR WHOM ARE YOU APPEARING IN THIS PROCEEDING?**

2 A. I am appearing on behalf of the Western Resource Advocates (“WRA”).

3 **Q. WHAT IS THE OBJECTIVE OF YOUR TESTIMONY?**

4 A. Tucson Electric Power Company (“TEP” or “the Company”) has filed an Application to
5 change its rates with the Arizona Corporation Commission (“ACC” or “the Commission”).
6 In its Application, the Company included a Depreciation Study with accompanying Direct
7 testimony. WRA has intervened in this case with the objective of advocating for certain
8 greenhouse emitting production plant to be retired earlier than the Company currently plans
9 to retire that plant. Acknowledging that this objective could have a short term economic
10 impact on consumers, WRA has retained my colleague Mr. Mike Majoros and myself to
11 review TEP’s Depreciation Study to determine whether off-setting adjustments can be
12 made to mitigate the rate impact on consumers. Mr. Majoros is providing testimony
13 regarding the rate treatment of Production plant.

14 The specific objective of my testimony is to review the Company’s proposed depreciation
15 rates and accruals for distribution and general plant. WRA witness Autumn Johnson is
16 providing testimony to the Commission regarding the specific policy proposal, and my

development and professional ethics of practitioners in the field of depreciation analysis; to collect and exchange information about depreciation analysis; and to provide a national forum of programs and publications concerning depreciation.” <http://www.depr.org/?page=AboutUs>. For certification, an applicant must have at least 5 years of full time professional depreciation experience, at least 2 years of which must be in the area of depreciation administration. Among other requirements, the applicant must pass a two part (Technical and Ethics) closed book examination which includes questions about, *inter alia*, Plant and Reserve Accounting, Life Analysis Concepts, Life Analysis Using Actuarial Models, Life Analysis Using Simulation Models, Salvage and Cost of Retiring Analysis, Technology Forecasting and Depreciation Calculations.” <http://www.depr.org/?page=Certification>.

1 colleague Mike Majoros is providing testimony regarding the accounting treatment of
2 Production plant. The objective of my testimony is to review the Company's Depreciation
3 Study and determine if there are adjustments that can be made to decrease the Company's
4 depreciation rates for Distribution or General functions. These adjustments do not, in all
5 cases, represent the most accurate depiction of the Company's historical retirements.
6 Rather, they are intended to meet the goal of providing offsets for ratepayers from the cost
7 increases resulting from the shorter depreciable lives of production plant.

8 **SUMMARY**

9 **Q. WHAT INFORMATION HAVE YOU REVIEWED IN PREPARATION FOR THIS**
10 **TESTIMONY?**

11 A. I have reviewed the written direct testimony and exhibits of Ronald White, including the
12 Depreciation Study Dr. White prepared. Upon examination of this testimony and the
13 Study, I prepared numerous data requests which were propounded by WRA at my request.
14 I have now had the opportunity to review TEP's responses to these data requests as well as
15 the documents attached to TEP's filing. In response to some of the data requests, WRA
16 has been provided the depreciation data used by Mr. White to perform his studies. Utilizing
17 this data, and my own analysis, I have proposed adjustments to the depreciation rates and
18 accruals utilized for plant depreciation proposed by TEP in its proceeding before the
19 Commission.

20 **Q. WOULD YOU PLEASE SUMMARIZE THE TOTAL IMPACT OF THE NET**
21 **SALVAGE ADJUSTMENTS YOU HAVE MADE?**

Yes. Please refer to the table below for comparison of the depreciation rates and expenses. This table shows the depreciation expense impact based on the depreciation rates proposed by TEP, and my recommended adjustments.

Table - 1
Comparison of TEP White v. SKM.
Overall Depreciation expense
Based on Dec. 31,2018 Plant Balances

Current	TEP	WRA	Difference <i>v. White</i>
Distribution	\$30,029,780	\$28,229,481	<i>\$(1,800,299)</i>
General	\$15,361,005	\$14,063,631	<i>\$(1,297,374)</i>
Total			<i>\$(3,097,673)</i>

Q. IN BRIEF, WHAT IS THE PRIMARY FACTOR, OR FACTORS, AS TO WHY YOUR PROPOSED DEPRECIATION RATES ARE LOWER THAN THE RATES PROPOSED BY COMPANY WITNESS WHITE?

A. The primary factors contributing to the lower depreciation rate are adjustments that I have made to the average service lives of seven distribution accounts and the amortization periods of four amortizable General plant accounts.

Q. ARE YOU SPONSORING ANY EXHIBITS IN CONJUNCTION WITH THIS TESTIMONY?

1 **A.** Yes, I am sponsoring two exhibits. I have prepared Exhibit JSG-1, which shows the
2 calculation of my proposed depreciation rates for service lives on the Distribution and
3 General functions. Exhibit JSG-2 contains the service life analysis for the accounts which
4 I am proposing to adjust.

5 **DISCUSSION OF SERVICE LIVES**

6 **Q. PLEASE DEFINE “AVERAGE SERVICE LIFE” AS IT IS USED IN UTILITY**
7 **DEPRECIATION CALCULATIONS.**

8 **A.** The “average service life” for a given account is a projection of the number years that a
9 new unit of plant can be expected to remain used and useful on average. Many units in a
10 given account will be retired at earlier ages, and thus have a shorter than average life, and
11 many units will retire at later ages, and thus have a longer than average life. Average
12 service life is used to calculate the average remaining life, which, in turn, is the
13 denominator in the calculation of depreciation expense. Therefore, all else being equal, a
14 longer average service life directly results in a lower depreciation expense.

15 **Q. PLEASE DESCRIBE THE PROPER WAY TO DETERMINE THE AVERAGE**
16 **SERVICE LIFE COMPONENT OF DEPRECIATION RATES.**

17 **A.** I have analyzed TEP’s transmission accounts using an actuarial life analysis process called
18 the Retirement Rate method. Actuarial methodologies were developed initially in the 17th
19 and 18th centuries, primarily by life insurance companies that needed mathematical means
20 of estimating the mortality risk of individuals over a long period of time. This resulted in
21 the development of “life tables,” which show the mortality risk of a group of individuals
22 with similar risk factors at each age.

1 The Retirement Rate method is an actuarial technique used to study plant lives,
2 much like the actuarial techniques used in the insurance industry to study human lives. It
3 requires a record of the dates of placement (birth) and retirement (death) for each asset unit
4 studied. Retirement data that contains this date of placement and retirement is referred to
5 as “aged data” because it tells the analyst the age of the plant at the time it was retired. The
6 Retirement Rate method is the most sophisticated of the statistical life analysis methods
7 because it relies on the most refined level of data.

8 In the Retirement Rate method, aged retirements and total plant in service at a given
9 age (referred to collectively as “exposures”) from a company’s records are used to
10 construct an observed or original life table. I discuss the composition of an observed life
11 table in detail below. The details are important because they result in data points showing
12 the percentage of a given unit of plant that is expected to survive at a given age. The
13 actuarial analysis smooths and extends the observed life table by fitting it to a family of 31
14 standardized survivor curves (“Iowa curves”). The curve-fitting uses the least squared
15 differences approach to find a best fit life for each curve. The “sum of least squared
16 difference” is a common means of fitting curves (in this case the Iowa curves) to a set of
17 data (in this case the observed life table data). The difference between each point of data
18 and a point on a line is squared, and the square of all of those differences is summed to
19 provide the total difference between the set of data and the line. The line that produces the
20 least difference from the set of data is considered the “best fit.” The purpose of squaring
21 the difference is to ensure that negative differences contribute to the overall difference
22 rather than canceling out positive differences.

Numerous iterative calculations are required for a Retirement Rate analysis. In the end, the analysis produces a life and Iowa curve best fit for a single average vintage. This is the same type of analysis that Mr. White has performed to arrive at his own proposed average service lives.

Q. WHAT ARE IOWA CURVES?

A. An Iowa curve is a surrogate or standardized observed life table based on a specific pattern of retirements around an average service life. The Iowa curves were devised over 60 years ago at Iowa State University. The curves provide a set of standard patterns of retirement dispersion. Retirement dispersion merely recognizes that accounts are comprised of individual assets or units having different lives.

For example, imagine an account that begins with a new addition of one hundred units. These units are unlikely to all retire at the same time. Rather, different units within the group will retire at different times. Represented graphically, the result might appear as follows:

Graph -1

In this example, the average service life would be fifty, and the retirement dispersion curve would tell us how the retirements are arranged around the average service life. In this example, the distribution of retirements around the average service life is symmetrical, with the “mode,” or the age with the highest number of retirements, being at the average service life. In this data, the retirements are also relatively tightly grouped around the average service life.

Iowa curves describe many different patterns of dispersions. Returning to our example, imagine a different pattern of retirements as follows:

Graph -2

In this example, the average service life is still fifty but the dispersion characteristics are very different. The mode is at age 40, which is an earlier age than the average, and overall the distribution of retirements is more spread out than in the previous example. By using different types of Iowa curves, I can capture these different characteristics that can be seen in retirement data.

One way that Iowa curves illustrate these different patterns is by their orientation as left-skewed, symmetrical or right-skewed curves, which are known, respectively, as “L

1 curves,” “S curves,” and “R curves.” The letters describe the location of the “mode,” as
2 discussed above, relative to the average service life. Hence, in the first example, which is
3 symmetrical, I would use an “S curve,” whereas in the second example, in which the mode
4 was at a younger age than the average service life, I would use an “L curve.” If the mode
5 falls after the average service life, then I would use an “R curve.” In addition to L, S and
6 R curves, there is a set of Origin Modal, or “O curves,” which are so called because the
7 mode for these curves is at age one, or the “origin.” Generally speaking, O-shaped Iowa
8 curves are not appropriate for utility plant.

9 In addition to the letter that describes the location of the mode, Iowa curves are
10 numbered one through six, which identifies the spread of the retirement dispersion. Lower
11 numbers represent a wider retirement dispersion. Referring back to the first example
12 above, in which the retirements were more tightly grouped around the average service life,
13 a higher number would be used, whereas in the second example, in which the retirements
14 were more diffuse, a lower number would be used.

15 To combine these two concepts, an appropriate Iowa curve for the first example
16 might be an S5, whereas an appropriate Iowa curve for the second example might be a L2.
17 This combination of one letter and one number defines a dispersion pattern. Adding an
18 average service life to an Iowa curve (e.g., 5-S0) provides a survivor curve intended to
19 depict a reasonable expectation of how a group of assets will survive, or conversely be
20 retired, over the expected average service life.

21 Table RC-0005-2 below compares curves with the same shape (S0) but different
22 average service lives (5- and 10-years) to illustrate different iterations with the same curve.
23 The percent surviving represents the amount of plant surviving at each age interval shown

in the first column. The 5S0 life and curve sums to the five-year average service life, while the 10S0 life and curve sums to a ten-year average service life.

Table-2

Sample Survivor Curves

<u>Age</u>	<u>5 S0 Curve Percent Surviving</u>	<u>10 S0 Curve Percent Surviving</u>
0.5	0.99	1.00
1.5	0.92	0.98
2.5	0.83	0.94
3.5	0.70	0.90
4.5	0.57	0.85
5.5	0.43	0.80
6.5	0.30	0.74
7.5	0.17	0.67
8.5	0.08	0.60
9.5	<u>0.01</u>	0.53
10.5		0.47
11.5		0.40
12.5		0.33
13.5		0.26
14.5		0.20
15.5		0.15
16.5		0.10
17.5		0.06
18.5		0.02
19.5		<u>0.00</u>
Total	5.00	10.00

These are called “curves” because, when plotted on charts with the x-axis representing “age” and the y-axis representing “percent surviving,” they appear as shown below in Graph 3:

Graph-3

Example of Same Curve With Different Lives

Q. HOW DO YOU USE THE IOWA CURVES IN YOUR SERVICE LIFE ANALYSIS?

A. The purpose of Iowa curves is to enable the calculation of an average remaining life. Remaining life calculations take the current age of each vintage within an account and then use the retirement rate projected by the appropriate Iowa curve to project the remaining life of each of these vintages of plant. Ultimately, depreciation accruals for plant investment are calculated from remaining lives, so it is important to select the correct average service life and the correct Iowa curve.

Q. IS IT NECESSARY TO FIT ALL OF THE AVAILABLE DATA POINTS TAKEN FROM THE OBSERVED LIFE TABLE?

A. No. In some cases, it is appropriate to disregard some or even many of the oldest aged data. This is because actuarial data that the company keeps often is tied to long-lived assets that represent so small a percentage of the total plant as to not be statistically significant or represent accounting anomalies, such as retirements that were never recorded. This

1 process, which is represented in the graphs below, is called a “T-cut.” While there is no
2 hard and fast rule for where a T-cut is appropriate, it is generally appropriate to make a T-
3 cut where the remaining retirement data diverges materially from the established pattern of
4 retirements seen to that point.

5 As will be discussed in detail below, the decision to make a T-cut, and at what point
6 in the data set to make the cut, is one of the most important, yet subjective, elements to an
7 actuarial analysis. In most cases, making a “larger” T-cut (that is, one that results in fitting
8 the curve to less of the actuarial data) will result in a shorter estimated average service life,
9 because the data eliminated is for the longest lived assets in the set of data.

10 Additionally, an inconclusive analysis may occur if data points are eliminated from
11 an observed life table with a limited data set (that is, an account that has reliably few
12 recorded retentions). Typically, the portion of an Iowa curve between 85% surviving and
13 15% surviving most distinguishes one curve from another. With the exception of O curves,
14 Iowa curves follow a parabolic distribution of retirements. That is, as we discussed above,
15 they tend to have limited retirements at the beginnings and ends of their life. Thus, the
16 portion between 85% and 15% surviving is the most indicative because that is when the
17 bulk of retirements in a given account happen, and where variation in the pattern of
18 retirements tends to occur. If a T-cut eliminates too much of the observed life table data,
19 the matching of that data to an Iowa curve will be more likely to produce ambiguous and
20 misleading results. I believe that the full set of aged data should be used in the service life
21 analysis unless specific circumstances warrant exclusion of the data.

22 **Q. DO YOU HAVE ANY CONCERNS WITH THE SERVICE LIVES COMPONENT**
23 **OF MR. WHITE’S DEPRECIATION STUDY FOR TEP?**

A. I do not have any general concerns with Dr. White's Study. Dr. White has conducted his analysis of TEP's service lives in an appropriate fashion, and has, for the most part proposed average service lives that are consistent with the historical data. However, for Accounts 361.00 – Structures and Improvements, Dr. White's proposed average service lives represent a significant departure from the historical data. As a result, for this account, I have proposed the average service life and curve shape that best fits the historical data.

Q. CAN YOU PROVIDE A SUMMARY OF THE SERVICE LIFE ADJUSTMENTS THAT YOU ARE PROPOSING?

A. Yes. The below tables summarizes the life adjustments that I have made for the depreciable accounts.

Table-3

		TEP Proposed Life-Curve	WRA Proposed Life-Curve
361.00	Structures and Improvements	60 - R1	75 - S0.5
362.00	Station Equipment	55 - R1.5	62 – R3
365.00	Overhead Conductors and Devices	55 – R4	60 – R5
366.00	Underground Conduit	60 - R4	67 – S6
368.UG	Line Transformers – Underground	50 - R2	54 – L2
369 UG	Services – Underground	65 – S4	68 – S6
370.00	Meters	17 – L0.5	20 – L0.5

Q. CAN YOU DESCRIBE THE BASIS FOR THE ADJUSTMENTS THAT YOU HAVE MADE FOR THESE SEVEN ACCOUNTS?

A. Yes. As described above, for Account 361.00 I have proposed an average service life that is in line with the historical retirement record. For the other six accounts, I am proposing longer average service lives that are longer than supported by the historical record, but with

curve-shapes that represent expectations of higher retirement rates in the more distant future. This achieves the goal of providing depreciation rate decreases in the short term to offset earlier production plant retirements, while at the same time attempting to align long-term depreciation rates with those of the best-fitting life-curve combinations.

Q. HAVE YOU PROVIDED THE RESULTS OF YOUR MATHEMATICAL FITTING ANALYSIS?

A. Yes, Exhibit JSG-2 includes a Schedule titled “Best Fit Curve Results” for each account studied that shows my mathematical curve fitting analysis. For each of these accounts, I have selected the best-fitting life and curve combination.

AMORTIZABLE GENERAL ACCOUNTS

Q. CAN YOU DESCRIBE THE ADJUSTMENTS YOU ARE PROPOSING TO THE COMPANY’S AMORTIZABLE ACCOUNTS?

A. Yes, the table below summarizes the adjustments I have made to the amortization periods for four of the Company’s accounts.

Table-4

	TEP Proposed Amortization	WRA Proposed Amortization
391.20 Network and Data Equipment	5	7
393.00 Stores Equipment	15	20
394.00 Tools, Shop and Garage Equipment	17	20
395.00 Laboratory Equipment	17	20

Q. HOW ARE AMORTIZATION PERIODS FOR GENERAL ACCOUNTS DETERMINED?

1 A. Amortization periods for general accounts are essentially arbitrary, and are based on a
2 reasonable estimate of the average life of a given plant type. For each of the accounts
3 listed above, I have reviewed the available plant records, as well as the amortization
4 periods utilized for other Company's for each account. In my estimation, these
5 adjustments to the amortization periods, and the depreciation rates that result, represent
6 reasonable adjustments to the periods and rates proposed by Dr. White.

7 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

8
9 A. Yes.

Experience

Snively, King, Majoros, and Associates, Inc.

Consultant (2010-Present)

Mr. Garren provides expert witness testimony to clients, specializing in the area of depreciation. Mr. Garren also provides analytical support to SK clients and principals including quantitative and qualitative analysis, preparation of client presentations, and case management. Mr. Garren works primarily in the areas of depreciation but has also prepared exhibits for use in the revenue requirement, cost-allocation, rate design, and rate of return aspects of regulatory proceedings. Mr. Garren has also assisted with the preparation of two valuation studies on municipal water companies.

Mr. Garren is a member of, and has been made a Certified Depreciation Professional, by the Society of Depreciation Professionals. In addition, Mr. Garren has attended the National Association of Regulated Utility Commissioners' Rate School.

Issue Advocacy Organization

State Policies Assistant 2009

Assisted with a wide variety of tasks including, but not limited to research, updating organization website with current news, extensive member/supporter communication, and database maintenance.

Binder and Binder, LLC

Client Advocate/Non-Attorney Representative 2007-2008

Mr. Garren's primary duties at Binder were legal writing; producing client and ALJ correspondence, case memoranda, expert witness interrogatories, and arguments in favor of appeal. From July 2007 acted as the company president's primary legal writer. In June of 2007, Mr. Garren became certified as a non-attorney representative. From that time, responsibilities included performing three to five Social Security Disability hearings per week.

Mr. Garren was also responsible for thoroughly developing medical and vocational evidence from the initial filing phase, through Administrative hearing.

Education

Marlboro College, Marlboro, Vermont, B.A. - Literature and Philosophy

Mr. Garren fulfilled Marlboro College's graduation requirement with a thesis on ethical issues in the works of Dostoevsky and Nietzsche. Exploring early post-modern ethical thinking in literature and philosophy.

James Shay Garren

1 **I. INTRODUCTION**

2 **Q. Please state your name and summarize your position and qualifications.**

3 A. My name is Michael J. Majoros, Jr. I am president of Snavelly King Majoros &
4 Associates, Inc. (“Snavelly King Majoros or SKM”). SKM is an economic consulting
5 firm specializing in public utility and telecommunications costs and rates. Appendix A is
6 a brief description of my qualifications and experience. It also contains a listing of my
7 appearances before state and federal regulatory bodies. I am submitting this testimony on
8 behalf of Western Resource Advocates (WRA).

9 **II. PURPOSE AND SUBJECT OF TESTIMONY**

10 **Q. What is the purpose and subject of your testimony?**

11 A. Western Resource Advocates (WRA) retained my firm to review the depreciation
12 aspects of Tucson Electric Power Company’s requested rate increase. My testimony
13 addresses the Company’s request to incorporate into its service rates a \$16.5 million¹
14 depreciation expense increase. I focus on the Company’s production plant depreciation
15 changes and my associate James S. Garren addresses the company’s transmission,
16 distribution and general plant depreciation proposals. WRA asked us to review TEP’s
17 filing and testimony related to asset depreciation and to provide testimony on a proposal
18 for preserving the retirement dates on gas units, adjusting the depreciation schedule of
19 those facilities to and reducing depreciation on other assets in order to minimize rate
20 impacts.

21 **III. WRA**

22 **Q. Please describe WRA.**

23 A. WRA is a non-profit conservation organization dedicated to protecting the land,
24 air, and water of the West. WRA’s Clean Energy Program develops and implements
25 policies to reduce environmental impacts of the electric power industry in the Interior

26 ¹ Docket No. E-01933A-19-0028 Direct Testimony of Ronald E. White (White Testimony). pages 2 – 3.

1 West by advocating for a western electric system that provides affordable and reliable
2 energy, reduces economic risks, and protects the environment through the expanded use
3 of energy efficiency, renewable energy resources, and other clean energy technologies.

4 **IV. QUALIFICATIONS**

5 **Q. What are your qualifications to present this testimony?**

6 A. I have 40 years' experience in the public utility field. I have testified on numerous
7 utility accounting and ratemaking issues and I have studied and debated the use of the
8 customers' discount rate revenue requirement comparisons in a presentation to the Iowa
9 State Regulatory Conference in 1986. Those comments are relevant in this proceeding.
10 Also, my firm specializes in public utility depreciation. Our clients have ranged from
11 consumer organizations and utility commissions to large companies that purchase
12 regulated utility services. We have appeared as expert witnesses on depreciation before
13 the regulatory commissions of more than half of the states in the country including
14 Arizona. I have testified in well over 100 proceedings on the subject of public utility
15 depreciation. I have also negotiated on behalf of clients in fifteen of the Federal
16 Communications Commission's ("FCC") triennial depreciation represcription
17 conferences.

18 **Q. Do you have any experience in the environmental field?**

19 A. I have some tangential environmental experience. In 2005 I testified on behalf of
20 the U.S. EPA staff in a court case involving a utility's plant modifications and how they
21 related to the Clean Air Act. In 2006, I appeared before the Maryland General Assembly
22 and the Maryland House of Delegates regarding a utility's capability to finance
23 improvements required by the Maryland Healthy Air Act.

1 **V. SUMMARY OF COMPANY'S FILING**

2 **Q. Please summarize the Company's filing.**

3 A. TEPs Application indicates that its requesting an overall increase in *non-fuel* retail
4 revenues of \$114.9 million partially offset by a \$38.9 million decrease to base fuel
5 revenues ... resulting in an overall \$76.0 million increase to retail revenues which is
6 approximately 7.8% over test year retail revenues.² TEP states it is also seeking approval
7 of updated depreciation rates.³

8 **Q. Please summarize the source and details of TEPs current depreciation rates.**

9 A. The Commission established the current despeciation rates in a settlement of
10 Docket Nos. E-01933A-15-0239 and E-01933A-15-0322, Order No. 75975. The parties
11 accepted TEP's proposed depreciation rates, "except (i) that the rates for San Juan
12 Generating Station would be adjusted to reflect a depreciable life of TEP's total
13 investment, including the Balanced Draft project, at San Juan Unit 1 of (6) years; (ii) \$90
14 million of excess distribution reserves will be transferred will be transferred to San Juan Unit 1
15 and(iii) a change in depreciation rates on TEP's distribution plant to offset the change in
16 depreciation expense for San Juan Unit 1."⁴

17 **Q. What are the specifics of TEPs updated depreciation requests?**

18 A. TEP is "proposing new depreciation rates based on an updated depreciation study.
19 The updated depreciation rates would modify the depreciation rates approved by the
20 Commission in Decision No. 75975."⁵ The Company provides the pre-filed direct
21 testimonies and exhibits of several witnesses supporting its requests. Dr. Ron White
22 supports the depreciation methodology and rates.⁶

23

24

25 ² Docket No. E-01933A-19-0028 ("Application") page 1.

26 ³ Id.

⁴ Settlement Document, page 4.

⁵ Application, page 6.

⁶ Id., pages 7- 8.

1 **Q. How does Dr. White describe his presentation?**

2 A. TEP engaged Dr. White's firm to conduct a 2018 depreciation rate study for
3 electric plant subject to the Arizona Corporation Commission's ("ACC") jurisdiction.⁷
4 TEP also asked Dr. White to develop 2019 depreciation rates for Gila River Unit 2.⁸ The
5 purpose of his testimony is to sponsor and describe his studies – Exhibit REW – 1.⁹ Dr.
6 White based his 2018 rates and accruals on December 31, 2017 plant and accumulated
7 depreciation balances. Dr. White's proposals will increase TEPs 2018 annualized accrual
8 by \$16.5 million as follows:

9 **Dr. White's Reported Increase to 2018 Depreciable Plant Annualized Accrual**¹⁰
10 (\$millions)

10 Steam Production	\$11.5
11 Other Production	(3.5)
11 Transmission	2.2
12 Distribution	6.1
12 General	(.2)
13 Net salvage (Trans.)	.2
13 Net Salvage (Dist.)	.2
14 Total	\$16.5

15

16 Dr. White's composite 2018 accrual rate for TEP electric operations is 2.89 percent
17 compared to the current 2.60 percent.¹¹

18 **Q. Does Dr. Whites also propose an increase to depreciation expense for Gila**
19 **River Unit 2?**

20 A. Yes, Dr. White proposes an additional \$3.4 million 2019 annualized accrual for
21 the Gila River Unit 2 which TEP proposes to purchase.

22 **Q. How did Dr. White calculate his proposed production plant depreciation**
23 **rates?**

24

25 ⁷ Docket No. E-01933A-19-0028 Direct Testimony of Ronald E. White (White Testimony). pages 2 – 3.

25 ⁸ Id., pages 2-3.

26 ⁹ Id., page 3.

26 ¹⁰ Id., pages 10-11.

26 ¹¹ Id., page 11.

1 A. Dr. White used the “straight-line method, vintage group procedure and remaining-
2 life technique.”¹² Dr. White used the life-span procedure combined with the vintage
3 group procedure to calculate weighted average remaining lives to calculate remaining life
4 rates for the production plant units. He used the vintage group procedure to account for
5 interim retirements estimated to occur prior to the ultimate final retirement of each unit.

6 **Q. What are the primary drivers of the functional expense changes summarized**
7 **above?**

8 A. Dr. White states the primary drivers of the changes above (all functions) “is the
9 retirement years changes described in the Direct Testimony of Michael E. Sheehan on
10 page 7.”¹³

11 **Q. Did Dr. White also calculate a 2019 proposal for Gila River Unit 2 in**
12 **anticipation of the pending purchase?**

13 A. Yes.

14 **Q. What is Dr. White’s Gila River Unit 2 proposal?**

15 A. Dr. White proposes a 2063 final retirement year for Gila Unit 2 in lieu of the 2048
16 final retirement year underlying the Gila Unit 2 PPA. Dr. White’s Gila River Unit 2
17 proposal would increase the 2019 annualized accrual (to be included in 2020 expense)
18 by \$3.4 million.¹⁴ Since Gila River Unit 2 will be recorded in the Other Production
19 Function it is reasonable to assume that the additional \$3.4 million would offset the \$3.5
20 million Other Production reduction for 2018.¹⁵

21 **Q. What is the implied net depreciation expense change combining the 2018**
22 **study and the 2019 Gila River Unit 2 study?**

23 A. The numbers above imply a net increase of about \$19.9 million but that amount
24 reflects two different time periods.

25 ¹² Id., page 10.

26 ¹³ Response to WRA 2.02

¹⁴ White Testimony, Page 11.

¹⁵ Currently, TEP pays for Gila Unit 2 energy through a PPA.

Dr. White's Implied Net Increase to 2018 Annualized Accrual¹⁶

(\$millions)

Steam Production	\$11.5
Other Production with Gila Unit 2	(.1) ¹⁷
Transmission	2.2
Distribution	6.1
General	(.2)
Net salvage (Trans.)	.2
Net Salvage (Dist.)	<u>.2</u>
Total	\$19.9

Q. Does TEP adjust the 2018 net increase to arrive at a 2019 proforma depreciation expense?

A. Yes. Mr. Jason Rademacher is TEP's sponsoring witness for its overall revenue increase and several pro forma adjustments. He transforms the implied \$19.9 million net increase into what appears to be a \$28.8 million total company increase in the company's 2019 revenue requirement calculation.¹⁸ The final 2019 revenue requirement depreciation expense for depreciable plant appears to be:

TEP's 2019 Proforma Adjustment to 2018 Annualized Accrual¹⁹

(\$millions)

	Total	ACC
	Company	Jurisdiction
Steam Production	\$(16.4)	\$(14.7)
Other Production with Gila Unit 2	5.7	5.1
Transmission	3.0	0.0
Distribution	34.0	34.0
General	3.5	2.8
Net salvage (Trans.)		-
Net Salvage (Dist.)		-
Total	\$28.8	\$27.2

¹⁶ White Testimony, Page 11.

¹⁷ 2018 \$3.5 million Other Production decrease plus Gila River Unit 2 \$3.4 million increase. (-\$3.5 million + \$3.4 million equals - \$.1 million.)

¹⁸ Adjusted Test Year Income Statement. See WRA 1.03, UDR 1.001 Proforma Adjustments.

¹⁹ Rademacher Workpapers.

1 **Q. Did you attempt to reconcile the numbers from Dr. White's studies to the**
2 **company revenue requirement calculations?**

3 A. Yes, WRA 2.07 asked the Company to "Please reconcile all plant and reserve
4 amounts included in Dr. White's study with the equivalent amounts from Mr.
5 Rademacher's [revenue requirement] schedules." The Company responded that "If WRA
6 is referring to rate base schedules showing plant in service and accumulated depreciation,
7 they are not comparable to Dr. White's study. Dr. White's study is based on amounts as
8 of December 31, 2017 while the Company rate base schedules are based on amounts as of
9 12/31/2018."²⁰

10 **Q. Was this helpful?**

11 A. It was somewhat helpful, however we were referring to all amounts, including
12 depreciation rates and accruals, in Dr. White's studies. Based on my review of the
13 Company's revenue requirement workpapers, it appears that the Navajo and Sundt
14 retirements account for the downward swing in the Steam Production function. I do not
15 know what accounts for the upward swings in the Other Production and Distribution
16 functions. Nevertheless, we were able to conduct our studies without further pursuit of
17 TEP's response to WRA DR 2.07 because we focused our analysis solely on Dr. White's
18 studies.

19 **VI. REMAINING TOPICS**

20 **Q. What topics will you address in the remainder of your testimony?**

21 A. I am recommending several changes to Dr. White's study. I am recommending
22 retention of any lives that TEP proposes to shorten. In addition, I am recommending
23 decelerated sum-of-the-years-digits depreciation for the Gila River units – including Gila
24 River Unit 2. Finally, I am recommending the exclusion of decommissioning costs from
25

26

²⁰ Response to WRA 2.07.

1 the Company's production plant depreciation rates. I will explain further by addressing
2 the following topics:

- 3 • TEP's Proposed Final Retirement Years, Interim Retirements and Remaining-Life
4 Depreciation;
- 5 • TEP's Revenue Requirement Levelization Approach;
- 6 • Alternative depreciation methods, including a comparison of straight-line,
7 accelerated and decelerated depreciation expense and revenue requirement; and
- 8 • TEP's proposed decommissioning costs.

9 **VII. TEP'S PROPOSED FINAL RETIREMENT YEARS, INTERIM**
10 **RETIREMENTS AND REMAINING-LIFE DEPRECIATION**

11 **Q. What is a final retirement year?**

12 A. A final retirement year ("FRY") is the year TEP records "the retirement of a major
13 structure unit [e.g. generating unit] in its entirety, or a very large part of it, as opposed to
14 interim retirements."²¹ The period between the study date (in this case December 31,
15 2017) and the FRY is the remaining life span.²²

16 **Q. Did Dr. White estimate or compute the FRYs he used in his calculations?**

17 A. No, Dr. White obtained the FRYs from Mr. Sheehan.

18 **Q. What final retirement years does Mr. Sheehan propose?**

19 A. Exhibit___(MJM-1) is drawn from Mr. Sheehan's Text Tables 1 and 5. It shows
20 the Company's FRY estimates sorted by the Steam Production Function Units (Plant
21 account numbers 310 to 316) and its Other Production Function Units (plant account
22 numbers 340 to 346.) It also shows the fuel type by unit and the FRYs underlying the
23 current depreciation rates and Mr. Sheehan's new FRYs.

24
25 _____
26 ²¹ Public Utility Depreciation Practices August 6, 1996; National Association of Regulatory Utility Commissioners,
("NARUC Manual") page 319.

²² Id., pages 321 and 323.

1 **Q. Does Exhibit___(MJM-1) show Mr. Sheehan's proposed increases and**
2 **decreases as well as your recommendations?**

3 A. Yes.

4 **Q. What are your recommendations?**

5 A. I recommend retention of the existing FRY for each unit for which the Company is
6 proposing a longer FRY. These include the following:

7

<u>UNIT</u>	<u>Current FRY</u>	TEP Proposed FRY	<u>SKM FRY</u>
H.W Sundt Common (Steam)	2048	2065	2048
Gila Unit 3 (Other)	2048	2063	2048
Gila Common (Other)	2048	2063	2048
Gila River Unit 2	2048	2063	2048
Luna (Other)	2051	2066	2051
H.W. Sundt CTs 1 (Other)	2027	2032	2027 ²³
H.W. Sundt CTs 2 (Other)	2027	2032	2027

15

16 **Q. Did Dr. White use Mr. Sheehan's FRY estimates to calculate his proposed**
17 **production plant depreciation rates?**

18 A. Yes, Dr. White used the FRY estimates in conjunction with the life span approach
19 to calculate average remaining lives ("ARL"). In turn, he used the ARLs to calculate his
20 proposed remaining-life depreciation rates for TEP's production plant units.

21 **Q. Please provide an example?**

22 A. Assume a \$1,300 plant unit is scheduled to be retired at the end of 2027. The
23 remaining life span would be 10 years and all other things being equal, Dr. White would

24 _____
25 ²³ Mr. Sheehan's Table 5 indicates the new FRY for Sundt Units 1 and 2 has been reduced from 2028 and 2030
26 respectively to 2020 for both. This is the result of the Company's plans to replace those Units with 10 18.2 MW
natural gas RICE units at Sundt. (Sheehan, page 8-9.) Dr. White excluded Sundt 1 & 2 from his study. Dr. White's
study was based on the assumption that the current Sundt CTs FRYs were 2027 for both and were extended to 2032
in his study. SKM has retained the 2027 FRY.

use the 10 years along with the 2017 net plant to calculate straight-line remaining life depreciation rate.

Q. What is net plant?

A. Net plant is gross plant in service minus accumulated depreciation. I have assumed the \$1,300 unit was previously depreciated by \$300 thus net plant would be \$1,000:

Net Plant Example

	<u>Amount\$</u>	<u>Percent%</u>
Gross Plant	\$1,300	100.00%
Accumulated Depreciation	(300)	(23.08%)
Net Plant	\$1,000	76.92%

Q. How would Dr. White calculate straight-line remaining-life depreciation using your example?

A. He would simply divide the net plant by the 10-year remaining life span as follows:

Straight-Line Remaining Life Depreciation Example

	<u>Amount\$</u>	<u>Percent%</u>
Gross Plant	\$1,300	100.00%
Accumulated Depreciation	(300)	(23.08%)
Net Plant	\$1,000	76.92%
Remaining Life Span Years	10	10
Annual Straight-Line Remaining Life Depreciation	\$10	7.692%

Application of the 7.693 percent rate to the \$1,300 gross plant balance would yield \$1,000 of accruals over the 10-year remaining life. The \$1,000 of new accruals plus the original \$300 of accumulated depreciation sum to the \$1,300 hence the entire original cost is allocated over the life of the asset.

1 **Q. What are interim retirements?**

2 A. The FRY is the year a majority of the original cost of a major asset such as a plant
3 unit retires. However, the life span procedure also recognizes the probability of
4 “retirements of component parts of a major structure prior to complete removal of the
5 retirement unit from service.”²⁴ These are interim retirements.

6 **Q. What is the impact of interim retirements in life span depreciation rate**
7 **calculations?**

8 A. Interim retirements have a shorter life than the remaining life span because they
9 are retired before the attainment of the FRY. These are factored into the calculation to
10 shorten the weighted average remaining life to recognize these early piecemeal
11 retirements.

12 **Q. Did Dr. White include interim retirements in his production plant remaining**
13 **life estimates?**

14 A. Yes, Dr. White used interim retirements to determine weighted average remaining
15 lives for each unit.

16 **Q. Please provide an example demonstrating Dr. White’s use of interim**
17 **retirements to calculate a weighted average remaining life.**

18 A. Dr. White proposes a 2040 FRY for Springerville Unit 1. That results in a 23-year
19 remaining life span as of December 31, 2017. However, Dr. White’s interim retirement
20 estimate reduced the 23-year remaining life span to a 21.83 year weighted average
21 remaining life. The shorter remaining life increased the resulting depreciation rate.

22 **Q. What is WRA’s position relating to TEP’s proposed FRY’s?**

23 A. As noted above and as indicated on Exhibit___(MJM-1) WRA objects to TEP’s
24 proposals to lengthen any lives. WRA recommends retaining the existing lives for those
25 accounts.

26

²⁴ NARUC Manual, page 321.

VIII. TEP'S LEVELIZATION APPROACH

Q. Exhibit ___(MJM-1) indicates that Mr. Sheehan proposes to shorten FRYs for some plant units and to lengthen the FRY's for some plant units. Can you explain his rationale?

A. Yes, Mr. Sheehan seeks to levelize production plant depreciation expense over a longer period of time. Mr. Sheehan states:

These depreciation life recommendations will accelerate the cost recovery related to future coal plant retirements while mitigating the rate impacts associated with incorporating more flexible natural gas generation needed to integrate higher levels of renewables. These proposed changes will provide the Company with a mechanism to levelize costs for customers as the Company continues its transition to a cleaner, lower cost and more sustainable resource portfolio.²⁵

Mr. Sheehan also explains:

As part of this rate case, the Company is proposing to shorten the useful lives of the coal and older natural gas steam resources at the Springerville and Sundt Generating Stations. Moreover, the Company is also proposing to extend the lives of its newest, highly efficient natural gas combined cycle units at the Gila River Power Station and the Luna Energy Facility. This 'gradualism' approach enables the Company to levelize its generating portfolio depreciation costs over a longer timeframe."²⁶

Q. Please summarize the theory of Mr. Sheehan's levelization approach.

A. Mr. Sheehan has shortened some lives which will increase near term revenue requirements due to higher straight-line depreciation expense and he has offset the increases with an extension of the existing H.W Sundt Common, Gila River Units, Gila River Unit 2 and Luna units.²⁷ It appears that these extensions could be inconsistent with a

²⁵ Direct Testimony of Michael E. Sheehan (Sheehan"), page 10 – 11.

²⁶ Response to WRA 2.22

²⁷ Mr. Sheehan lengthened the lives of the embedded Gila units on the Company's books at 12/31/17. Dr. White used those longer lives to compute 12/31/17 depreciation rates. In addition, Mr. Sheehan lengthened the life of Gila River Unit 2, even though the Company did not own that Unit at 12/31/17. Dr. White used the extended Gila 2 life to calculate 12/31/18 depreciation rates for that unit.

1 carbon neutral environment in the 2050 range.²⁸ At the same time, as noted above I am also
2 concerned about the near-term incremental revenue requirement impacts of the shorter lives
3 without the offsetting reductions resulting from longer lives.

4 **IX. ALTERNATIVE DEPRECIATION METHODS**

5 **Q. Are there any other ways the Company could reduce the up-front revenue**
6 **requirement increases?**

7 A. Yes. Mr. Sheehan bases his recommendations upon the continued use of straight-
8 line depreciation. Straight-line depreciation in turn produces a front-loaded revenue
9 requirement because rate base is at its highest level in the early part of an asset's life.
10 TEP could use a decelerated depreciation method to offset the increases resulting from
11 reducing the FRYs. This approach would not require forced extensions of existing and
12 new fossil-fueled production units like the Gila River Units.

13 **Q. Please explain how a decelerated depreciation method could offset**
14 **depreciation increases resulting from reducing final retirement years.**

15 A. I will discuss straight-line, accelerated and decelerated depreciation to demonstrate
16 my point. Assuming a 10-year life, the straight-line depreciation expense pattern is a
17 straight horizontal line at ten percent for the entire 10-year period. Accelerated and
18 decelerated depreciation calculate depreciation expense using the same 10-year life, but
19 with different patterns. The accelerated method frontloads depreciation starting with high
20 expenses that decline throughout the life. The decelerated pattern is just the reverse - low
21 depreciation expense in the beginning that increases over the life.

22 **Q. Please provide a comparison of an accelerated method and decelerated**
23 **method.**

24 ²⁸ For example, I understand The Intergovernmental Panel on Climate Change's 2018 report outlines several
25 findings (including the need to be carbon neutral by 2050) and also goes over authors/citations/peer review
26 information: <https://www.ipcc.ch/2018/10/08/summary-for-policymakers-of-ipcc-special-report-on-global-warming-of-1-5c-approved-by-governments/>.

1 A. The sum-of-the-years' digits ("SOYD") method can be used to demonstrate both
2 accelerated and decelerated depreciation over the same 10-year life. All three methods
3 (including straight-line) produce the same total depreciation over the 10-year life.

4 **Q. Does Dr. White recognize SOYD as a legitimate element of a depreciation**
5 **system?**

6 A. Yes.²⁹

7 **Q. How is SOYD calculated?**

8 A. SOYD depreciation is calculated by summing the total digits for a particular life.
9 A 10-year life has 55 digits, i.e. the sum of 1 to 10. These digits are then allocated to
10 time periods using an equation in which the denominator is the sum of the digits (55) and
11 the numerator is the year of the rate calculation. The approach results in accelerated if
12 the starting point is the last year of the string. The resulting rate starts high and then
13 increases. The approach is decelerated if the starting point is the first year of the string.
14 The resulting rate starts low and then increases each year. Exhibit__(MJM-2) contains
15 an example of straight-line depreciation of a \$1,000 asset over a 10-year life compared to
16 accelerated and decelerated SOYD both numerically and graphically.

17 **Q. Can you calculate remaining-life depreciation rates using the decelerated**
18 **SOYD method?**

19 A. Yes. The remaining life SOYD depreciation rates are calculated as normal and
20 then further multiplied by the beginning net book ratio. This is demonstrated in
21 Exhibit__(MJM-3).

22 **Q. Have you calculated the SOYD rates for TEPs production plant units?**

23 A. Yes, Exhibit__(MJM-4) calculates the remaining-life SOYD rates for all of
24 TEP's Steam Production Plant units as of December 31, 2017. Exhibit__(MJM-5)
25 calculates the remaining-life SOYD rates for all of TEP's Other Production units as of

26

²⁹ White Direct Testimony, page 6.

1 December 31, 2017; and Exhibit___(MJM-6) calculates the remaining-life SOYD rates
2 for Gila River Unit 2 as of December 31, 2018.

3 **Q. Would these SOYD depreciation rates remain constant over the remaining**
4 **life of each unit?**

5 A. No, the rates would increase each year as shown on the exhibits.

6 **Q. Would SOYD levelize revenue requirements?**

7 A. SOYD would offset the early higher straight-line revenue requirements but it
8 would not levelize revenue requirements. The only method that would do that is the
9 “sinking fund approach.” I am not recommending the sinking fund approach.

10 **Q. Would future customers face higher costs in the future using reverse SOYD**
11 **depreciation rates?**

12 A. Yes, but they would be paying for those costs with cheaper dollars as a result of
13 inflation.

14 **Q. Is SOYD typically used in regulation to set depreciation rates?**

15 A. No, neither accelerated nor decelerated SOYD is typically used in regulation to set
16 depreciation rates, however we face a significant challenge in the need to transition utility
17 assets from fossil-fuel resources to zero-carbon resources in a short period of time, while
18 trying to mitigate the rate impacts on customers. All things equal, shorter lives increase
19 depreciation rates. That challenge demands that we evaluate and, in certain cases adopt
20 nontraditional depreciation approaches such as what I am presenting in this proceeding. I
21 have described SOYD so the Commission can consider it as one possible solution to
22 dealing with accelerated FRYs. It is clear that in the past the Commission has considered
23 other atypical solutions such as shifting reserves between functions. Back in the 1980s
24 and 1990s the telecom industry was transitioning from an electro-mechanical to a digital
25 environment. The FCC allowed the industry’s request to adopt as a solution a “dying
26 plant amortization” approach for its electro-mechanical offices. SOYD is another

1 solution and in my opinion is systematic, rational and not arbitrary. It allocates the full
2 cost of a units to expense over the remaining life of the unit and there is no need to use
3 any inflation or interest rates in the calculation.

4 **Q. Are you recommending the remaining-life SOYD rates for all of TEPs**
5 **Production plant units?**

6 A. I am not recommending the remaining-life SOYD rates for all of TEP's production
7 units. I am recommending the remaining-life SOYD rates only for the Gila River units
8 for which I have shortened Dr. White's 2063 FRY back to the existing 2048 FRY. TEP
9 proposes to lengthen these lives to reduce depreciation relative to increase resulting from
10 other shorter lives. SOYD eliminates the need to lengthen the Gila River lives to reduce
11 depreciation.

12 **Q. Please explain why you are not recommending SOYD for the other units for**
13 **which TEP is proposing accelerated FRYs?**

14 A. It is not my goal to reduce substantially the Company's current depreciation
15 expense overall by adopting SOYD. On the other hand, I do not see a need for an
16 increase. As I will explain below, I am recommending exclusion of the Company's
17 proposed decommissioning from its depreciation rates. That exclusion has a relatively
18 significant effect, so if accepted it is not necessary to use SOYD for all of the units for
19 which TEP proposes accelerated FRYs.

20 **X. TEP'S PROPOSED DECOMMISSIONING COSTS**

21 **Q. Has Dr. White incorporated negative net salvage in his production plant**
22 **depreciation rates?**

23 A. Yes, Dr. White included negative net salvage ratios in his proposed depreciation
24 rates.

1 **Q. What is negative net salvage?**

2 A. Negative net salvage is a charge to ratepayers that assumes TEP will spend more
3 money than it will take in when it retires plant assets from service. Negative net salvage
4 increases depreciation rates.

5 **Q. How did Dr. White estimate the amount of negative net salvage to include in**
6 **the production plant depreciation rates?**

7 A. Dr. White estimated the amount of negative net salvage relating to interim
8 retirements. Next, he estimated the amount of future negative net salvage the Company
9 would incur when the units are ultimately retired in their FRYs. These are
10 decommissioning costs. He added his interim net salvage estimate to his
11 decommissioning estimate and converted them into ratios used in his production plant
12 depreciation rates.

13 **Q. How did Dr. White estimate these future decommissioning costs?**

14 A. Dr. White obtained decommissioning cost studies the Company had prepared by
15 external engineers. These costs were stated in 2018 dollars which Dr. White escalated to
16 the FRYs at a 2.00 percent inflation rate.

17 **Q. Do you object to including these decommissioning costs in depreciation rates?**

18 A. I object to including these decommissioning costs in depreciation rates because
19 TEP does not have any legal obligations to retire these units at any given date or to incur
20 these decommissioning costs when the units are retired.³⁰ TEP only has legal obligations
21 relating to restoring land to its original condition, landfill and pond closures and the
22 related closure care, mine reclamation, and asbestos abatement.³¹ Unfortunately, Dr.
23 White removed the costs of these actual obligations from the depreciation study and
24 replaced them with the escalated decommissioning costs.³²

25

26 ³⁰ Response to WRA 2.20 b.

³¹ Response to WRA 2.20 c.

³² Response to WRA 2.18

1 **Q. What do you recommend?**

2 A. I recommend disallowance of the escalated decommissioning costs from
3 depreciation rates. Exhibit___(MJM-7) calculates production plant net salvage ratios
4 relating only to the estimated interim retirements. I recommend inclusion of these in the
5 production plant depreciation rates.

6 **XI. SUMMARY**

7 **Q. Have you prepared tables comparing your recommendations to Dr. White's**
8 **2018 proposals and his 2019 proposals for Gila River Unit 2?**

9 A. Yes, Exhibit___(MJM-8) contains a comparison of the 2018 proposals to my
10 proposals reflecting my retention of existing lives as discussed above, my decommission
11 cost adjustment and the use of SOYD for the 2017 Gila River Units. Exhibit___(MJM-9)
12 contains a comparison of the 2018 proposals to my proposals reflecting my retention of
13 existing lives as discussed above, my decommission cost adjustment but without the use
14 of SOYD for the 2017 Gila River Units. Exhibit___(MJM-10) contains the 2019
15 proposals for Gila River Unit 2.

16 The following Table summarizes the results.

17 **Summary Results of SKM Lives, Net Salvage, and SOYD Adjustments Exhibit___(MJM-8) and (MJM-10)**
18 **(\$millions)**

19

2018 Steam Production 2018 Other Production 2019 Gila Unit 2			
Description			
TEP Proposal	\$81.5	\$12.8	\$3.4
SKM Proposal	\$69.5	\$9.8	\$.3
SKM Reduction	\$(12.0)	\$(3.0)	\$(3.1)

23

24 In summary, the Company has proposed a \$16.5 million annualized depreciation expense
25 increase overall for 2018. In addition, he proposes \$3.4 million of 2019 depreciation
26 expense for Gila River Unit 2. My production plant recommendations retain existing

1 lives for any unit for which the Company has reflected a longer life in its depreciation
2 study. I have excluded decommissioning costs from the Company's proposal and I have
3 used the SOYD depreciation procedure for the Company's existing Gila River units and
4 its planned Gila River Unit 2. My production plant recommendations reduce the
5 Company's depreciation increase by \$18.1 million. Mr. Garren's recommendations in
6 the distribution and general plant functions further reduce the Company's overall increase
7 by another \$3.1 million. Thus SKM proposes a \$21.2 decrease relative to the \$19.9
8 million increase in Dr. Whites filed study, for a net decrease of approximately \$1.3
9 million to the revenue requirement.

10 **Q. Does this conclude your testimony?**

11 A. Yes, it does.

Experience

Analytica94, Inc.

Chairman and Founder (2013 to present)

A94 is a chartable non-profit organization founded in 2013 to provide independent research, economic models, and training to evaluate the effectiveness of economic regulation of U.S. industries.

Snively King Majoros & Associates, Inc.

President (2010 to present)

Vice President and Treasurer (1988 to 2010)

Senior Consultant (1981-1987)

Mr. Majoros provides consultation specializing in accounting, financial, and management issues. He has testified as an expert witness or negotiated on behalf of clients in more than one hundred thirty regulatory federal and state regulatory proceedings involving telephone, electric, gas, water, and sewerage companies. His testimony has encompassed a wide array of complex issues including taxation, divestiture accounting, revenue requirements, rate base, nuclear decommissioning, plant lives, and capital recovery. Mr. Majoros has also provided consultation to the U.S. Department of Justice and appeared before the U.S. EPA and the Maryland State Legislature on matters regarding the accounting and plant life effects of electric plant modifications and the financial capacity of public utilities to finance environmental controls. He has estimated economic damages suffered by black farmers in discrimination suits.

Van Scoyoc & Wiskup, Inc., Consultant (1978-1981)

Mr. Majoros conducted and assisted in various management and regulatory consulting projects in the public utility field, including preparation of electric system load projections for a group of municipally and cooperatively owned electric systems; preparation of a system of accounts and reporting of gas and oil pipelines to be used by a state regulatory commission; accounting system analysis and design for rate proceedings involving electric, gas, and telephone utilities. Mr. Majoros provided onsite management accounting and controllership assistance to a municipal electric and water utility. Mr. Majoros also assisted in an antitrust proceeding involving a major electric utility. He submitted expert testimony in FERC Docket No. RP79-12 (El Paso Natural Gas Company), and he co-authored a study entitled Analysis of Staff Study on Comprehensive Tax Normalization that was submitted to FERC in Docket No. RM 80-42.

Handling Equipment Sales Company, Inc.

Controller/Treasurer (1976-1978)

Mr. Majoros' responsibilities included financial management, general accounting and reporting, and income taxes.

Ernst & Ernst, Auditor (1973-1976)

Mr. Majoros was a member of the audit staff where his responsibilities included auditing, supervision, business systems analysis, report preparation, and corporate income taxes.

University of Baltimore - (1971-1973)

Mr. Majoros was a full-time student in the School of Business.

During this period Mr. Majoros worked consistently on a part-time basis in the following positions: Assistant Legislative Auditor – State of Maryland, Staff Accountant – Robert M. Carney & Co., CPA's, Staff Accountant – Naron & Wegad, CPA's, Credit Clerk – Montgomery Wards.

Central Savings Bank, (1969-1971)

Mr. Majoros was an Assistant Branch Manager at the time he left the bank to attend college as a full-time student. During his tenure at the bank, Mr. Majoros gained experience in each department of the bank. In addition, he attended night school at the University of Baltimore.
